

## 1 Motivating Scenario (Developer)

Vulnerable code (CWE-125)

Junior Developer

First understand the code and then figure out how to fix CWE-125

Tasks before starting repair

- understand the function
- analyze the code structure
- understand CWE-125
- read similar examples and fixes as reference

Correct Fix

## 2 A vulnerable function and its fix (CWE-125)

```
1 static MagickBooleanType Get8BIMProperty(const Image *image, const char *key,
2 ExceptionInfo *exception)
3 {
4     ... /* 38 code lines are missed which contains 422 tokens */
5     while ((length > 0) && (status == MagickFalse)) {
6         ... /* 32 code lines are missed which contains 452 tokens */
7         count=(ssize_t) ReadPropertyMSBLong(&info,&length);
8 +        if ((count < 0) || ((size_t) count > length))
9 +            {
10 +                length=0;
11 +                continue;
12 +            }
13         ... /* 30 code lines are skipped for simplicity*/
14         attribute[count]='\0';
15         ... /* 25 code lines are skipped for simplicity*/
16     }
17 }
```

## 3 An example and fix from CWE system (CWE-125)

```
1 int getValueFromArray(int *array, int len, int index)
2 {
3     int value;
4     // len: length of the array
5     // if (index < len)
6 - if (index < len)
7 + if (index >= 0 && index < len) {
8     // get the value at the specified index of the array
9     value = array[index];
10    // if array index is invalid then output error message
11 }
12 else{
13     value = -1;
14 }
15
16 return value;
17 }
```
