

Explanation of \mathbf{x}_0 Redundant feature

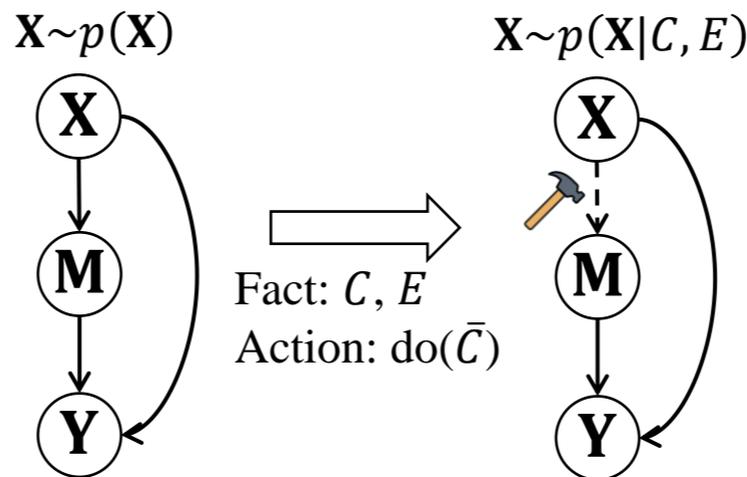

$\mathbf{s} = [0, 1, 1, 1]$ $\xrightarrow{\text{Def 3.1}}$ Event C

A feature subset selection of \mathbf{x}_0

\mathbf{y}_0^{ori} $\xrightarrow{\text{Def 3.2}}$ Event E

Original prediction of \mathbf{x}_0

(a) Construct events C and E with respect to \mathbf{s} and \mathbf{y}_0 , respectively.

Selection & perturbation process

Necessity counterfactual model

(b) Necessity Counterfactual.

Generation steps	Point1	Point2
1) Sample from $p(\mathbf{X} C, E)$	\mathbf{x}_1	\mathbf{x}_2
2) Assign variable \mathbf{M} a value satisfies event \bar{C}	\mathbf{m}'_1	\mathbf{m}'_2
3) Perturb \mathbf{x}_i with \mathbf{m}'_i and predict (Eq.3)	\mathbf{y}_1	\mathbf{y}_2

(c) Generate two data points $(\mathbf{x}_1, \mathbf{m}'_1, \mathbf{y}_1)$ and $(\mathbf{x}_2, \mathbf{m}'_2, \mathbf{y}_2)$, using necessity counterfactual model.

$PN(C, E)$

$$\simeq \frac{\mathbb{I}(f(\text{Perturb}(\mathbf{x}_1, \mathbf{m}'_1)) \notin Q) + \mathbb{I}(f(\text{Perturb}(\mathbf{x}_2, \mathbf{m}'_2)) \notin Q)}{2} = \frac{1+0}{2}$$

Where,

$$\begin{aligned} & \mathbb{I}(f(\text{Perturb}(\mathbf{x}_1, \mathbf{m}'_1)) \notin Q) \\ &= \mathbb{I}(f((0.2, 0.4, 0.6, \bar{0.8}) \odot (0, 1, 1, \bar{0})) \notin Q) \\ &= \mathbb{I}(f((0, 0.4, 0.6, \bar{0}) \notin Q) = 0 \\ & \mathbb{I}(f(\text{Perturb}(\mathbf{x}_2, \mathbf{m}'_2)) \notin Q) \\ &= \mathbb{I}(f((0.2, 0.4, 0.6, 0.8) \odot (0, 1, 1, 0)) \notin Q) \\ &= \mathbb{I}(f((0, 0.4, 0.6, 0) \notin Q) = 1 \end{aligned}$$

\mathbf{m}'_1 only perturbs redundant feature of \mathbf{x}_1 (Key to measuring redundancy)

(d) Feed the generated data points into Eq.10 to estimate $PN(C, E)$.
