 3a74746e3f184829, μ title = "An induced proximity
 model for NF- κ B activation in the Nod1/RICK and RI
 P signaling pathways", μ abstract = "Nod1 is an Ap
 af-1-like molecule composed of a caspase-recruitme
 nt domain (CARD), nucleotide-binding domain, and l
 ucine-rich repeats that associates with the CARD-
 containing kinase RICK and activates nuclear facto
 r κ B (NF- κ B). We show that self-association of No
 d1 mediates proximity of RICK and the interaction
 of RICK with the γ subunit of the IKK kinase (IKK
 γ). Similarly, the RICK-related kinase RIP associ
 ated via its intermediate region with IKK γ . A mut
 ant form of IKK γ deficient in binding to IKK α and
 IKK β inhibited NF- κ B activation induced by RICK o
 r RIP. Enforced oligomerization of RICK or RIP as
 well as of IKK γ , IKK α , or IKK β was sufficient for
 induction of NF- κ B activation. Thus, the proximit
 y of RICK, RIP, and IKK complexes may play an im
 portant role for NF- κ B activation during Nod1 oligo
 merization or trimerization of the tumor necrosis

... specific protein-binding interactions leading
 to low backgrounds in immunoprecipitation. Still,
 RIPA buffer is very compatible with a myriad of ap
 plications, including reporter assays, protein ass
 ays, immunoassays and protein purification. When p
 rotein quantitation is desired, RIPA buffer is the
 lysis buffer of choice due to its compatibility wi
 th the BCA Protein Assay, although it can denature
 kinases [5], and can disrupt protein-protein inter
 actions in immunoprecipitation/pull down assays [6
]. μ Urea buffer is another versatile and efficien
 t cell and tissue lysing buffer whose typical comp
 osition include: TRIS base 40 mM, Urea 7 M, Thiou
 rea 2 M, NP-40 or CHAPS 4%, DTT 10 mM. Urea is
 used at concentrations ranging from 5 to 9 M, often
 with thiourea at concentrations up to 2 M. The addi
 tive thiourea can dramatically enhance the solubilit
 y of a wide range of proteins - nuclear, membrane,
 cytosolic, and including even tubulin that is high
 ly prone to aggregation, in urea buffer [1, 3, 4].
 As in RIPA buffer, different detergents and buffer

 ling the Bacterial Chromosome: Condensin's Role in
 Sister Chromosome Separation and its Mechanisms μ
 Researcher (PI) Stephan Gruber μ Summary A prereq
 uisite for chromosome segregation in all living org
 anisms is the topological unlinking of sister DNA
 molecules, called DNA decatenation. Decatenation i
 s performed by DNA topoisomerases that work by tra
 nsiently breaking strand(s) in one DNA double heli
 x and passing another double helix through the tem
 porarily created gate. How DNA topoisomerases mana
 ge to recognize linkages between sister DNA molecu
 les and how they promote decatenation of sister ch
 romatids (but not catenation) is still largely unk
 nown. The driving hypothesis of this project is th
 at condensin promotes chromosome decatenation by g
 uiding the unlinking activity of DNA topoisomerase
 s. Condensin is a member of the family of SMC (Str
 uctural Maintenance of Chromosomes) protein comple

... nd probably result in gangrenous mastitis. So
 these leukocytes are beneficial by destroying bact
 eria; however, leukocytes are also detrimental bec
 ause high numbers of them are associated with dec
 eased milk production and poor milk quality. μ To
 understand this relationship, we need to review th
 e anatomy of the udder and how milk is produced. J
 ust as nutrients are transported from the bloodstr
 eam into mammary tissues to be converted into mil
 k, leukocytes are also transported into milk as a s
 urveillance mechanism to look for bacteria. In the
 typical uninfected mammary quarter, the leukocyte
 (or somatic cell) numbers remain less than 200,000
 /mL. Now, keep in mind that each mammary quarter i
 s composed of millions of microscopic alveoli. Eac
 h alveolus, which is drawn out of proportion in th
 e figure below, is a three-dimensional sphere com
 posed of a layer of milk-producing cells that surr
 ounds a lumen or collecting space, which drains mi
 lk to the gland and teat cisterns before exiting t
 hrough the teat duct during milking. μ In order fo

... microscopy, intracellular events can be linked
 to external factors such as cell-cell interaction
 and ultimate cell fate. These methods give us rema
 rkable new insights into the dynamics of gene exp
 ression, cellular interactions, and heterogeneous p
 rocesses. In fluorescence imaging, a laser is used
 to excite the fluorophores at a particular wavelen
 gth. Full field epifluorescence can then be used t
 o measure the light as the fluorescent tags emit l
 ight while returning to their unexcited molecular
 state [23]. In confocal imaging, a pinhole in comb
 ination with focused laser light is introduced to
 effectively reduce background fluorescence and all
 ows optical sectioning of the sample by mechanical
 scanning. Varying the pinhole will effectively var
 y the thickness of the sample being imaged, the im
 age resolution, and the acquisition time. μ For so
 me applications, the use of fluorescent tags is no
 t feasible. By continuously filming embryo materia
 l some important information on cell outline, posi
 tion, shape, and texture can be extracted from the

... s and is regarded as a candidate tumor suppres
 sor gene; however, the mechanism by which BLCAP
 exerts its function remains elusive. This study inve
 stigated the functional association between BLCAP
 and proliferation or apoptosis in cervical cancer
 cells, to identify the functional motifs of BLCAP.
 The BLCAP-shRNA expression vector based on pRNA-U6
 .1/Hygro plasmid was used to specifically inhibit
 BLCAP activity in HeLa cells. The optimal shRNA pl
 asmid was selected to knock down BLCAP expressi
 on and the biological effects were investigated. The
 effects on cell cycle and apoptosis were detected
 by flow cytometric or Annexin V-FITC staining anal
 ysis. The gene expression profiles of HeLa cells t
 ransfected with bclcap-wt and BLCAP-shRNA were an
 alyzed using human signal pathway gene Oligochips.
 The levels of protein expression and interaction of
 BLCAP with Rb1 proteins were determined by west
 ern blotting and Co-IP assays. The site-specific mut
 agesis assay was used to identify amino acid resid
 ues important for BLCAP. Significantly differentia
