

## Simulation

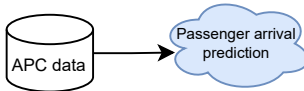

Replicates the transit system to estimate the impact of stationing and dispatching

 Disruption or overage events

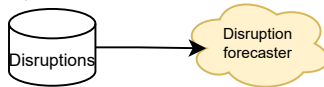

## Passenger Arrival Model

Trained passenger arrival models from real-world APC data. Used as generative models for creating various chains of events

## Disruption Forecast

Disruption models trained on real-world public transit incident data across 3 years. Ability to predict **trip level disruptions**

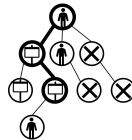

State updates,  
Estimated rewards

## Decision Agent

Evaluates stationing & dispatching actions by estimating long-term effects

*Monte Carlo Tree Search*  
Online algorithm; no training needed  
To generate optimal actions while accounting for stochasticity

Optimal dispatch and  
stationing actions

## Reward function

total passengers served  
deadhead miles traveled
