

Incorrect Steps

Instruction: Four children are playing together, Akbar, Alessandro, Helene, and Wilfred. Helene is twice as old as the average age of the group, and the total age of the children is 20. If Akbar is 3 years old and Alessandro is 4 years old, calculate the age of Wilfred. Let's write a program.

Ours:

```
total_age = 20
akbar_age = 3
alessandro_age = 4
average_age = total_age / 4
helene_age = 2 * average_age
wilfred_age = total_age - (akbar_age +
alessandro_age + helene_age)
print(wilfred_age)
```

Prediction: 3

MAmmoTH-coder:

```
akbar_age = 3
alessandro_age = 4
```

average_age = (akbar_age + alessandro_age) / 2 ❌

```
helene_age = 2 * average_age
```

```
total_age = 20
```

```
wilfred_age = total_age - (akbar_age +
alessandro_age + helene_age)
```

```
print(wilfred_age)
```

Prediction:6

(a)

Missing Steps

Instruction:

Matthew had 15 crackers. **If Matthew gave equal numbers of crackers to his 5 friends and still had 10 crackers left How many crackers did each friend eat?** Let's write a program.

Ours:

```
total_crackers = 15
friends = 5
crackers_left = 10
crackers_each_friend = (total_crackers -
crackers_left) / friends
print(crackers_each_friend)
```

Prediction: 1

MAmmoTH-Coder:

```
total_crackers = 15
remaining_crackers = 10
crackers_per_friend = total_crackers -
remaining_crackers
```

friends = 5

crackers_each_friend = (total_crackers -
crackers_left) / friends ❌

```
print(crackers_per_friend)
```

Prediction: 5

(b)

Redundant Steps

Instruction: Becky, Jake, and Silvia shared 4 pizzas. Each pizza had 8 slices. Becky ate 3 more slices than Jake did. Silvia ate twice as many slices than Jake did. If Becky ate 10 slices, how many total slices did they eat? Let's write a program

Ours:

```
total_pizzas = 4
slices_per_pizza = 8
total_slices = total_pizzas * slices_per_pizza
becky_slices = 10
jake_slices = becky_slices - 3
silvia_slices = jake_slices * 2
total_slices_eaten = becky_slices + jake_slices +
silvia_slices
print(total_slices_eaten)
```

Prediction: 31

MAmmoTH-Coder:

```
total_pizzas = 4
slices_per_pizza = 8
becky_slices = 10
jake_slices = becky_slices - 3
silvia_slices = jake_slices * 2
total_slices = total_pizzas * slices_per_pizza
total_eaten = becky_slices + jake_slices + silvia_slices
```

remaining_slices = total_slices - total_eaten
print(remaining_slices) ❌

Prediction: 1
