

## COT 样例

### Instruction:

Tom paints a room that has 5 walls. Each wall is 2 meters by 3 meters. John can paint 1 square meter every 10 minutes. He has 10 hours to paint everything. How many hours does he have to spare?

### Response:

1. Each wall is  $2*3=6$  square meters
2. So each wall takes  $6*10=60$  minutes to paint
3. So it takes  $60/60=1$  hour to paint each wall
4. That means in total it takes  $5*1=5$  hours to paint
5. So he has  $10-5=5$  hour left after finishing painting
6. The answer is 5

## POT 样例

### Instruction:

Gus eats 2 eggs-omelet for breakfast. He has an egg salad sandwich made with 3 eggs for lunch. He then has an egg drop soup made with 1 egg for dinner. How many eggs did Gus eat altogether? Let's write a program.

### Response:

```
# define the number of eggs Gus eats for each meal
breakfast_eggs = 2
lunch_eggs = 3
dinner_eggs = 1
# calculate the total number of eggs Gus eats
total_eggs = breakfast_eggs + lunch_eggs + dinner_eggs
# print the result
print(total_eggs)
```
