

An Event is defined as something happens in a sentence. In this task, we are trying to identify whether one or more of the following events exist in a given string: *infect*, *spread*, *symptom*, *prevent*, *control*, *cure*, and *death*. And if an event exist, what is the major **triggering word** that mostly manifest its occurrence.

Event	Definition
infect	The process of a disease/pathogen invading host(s).
spread	The process of a disease spreading/pervailing massively at a large scale.
symptom	Individuals displaying physiological features indicating the abnormality of organisms.
prevent	Individuals trying to prevent the infection of a disease.
control	Collective efforts trying to impede the spread of a pandemic.
cure	Stopping infection and relieving individuals from infections/symptoms.
death	End of life of individuals due to infectious disease.

If there exist any explicit negation of an Event, we say that Event does NOT exist and do not mark it.

Important Notes:

There can be sentences without any events. No need to annotate anything for such sentences.

A trigger word can be linked to one or more events. Choose all possible events in such cases.

Multiple events can be presented in a given sentence. Mark all such events.

The same event can occur multiple times (at different parts) in the same sentence. Mark all occurrences of the event.

You will be able to submit the HIT at the last sentence once you finish annotating all the sentences.

Select "flag" event if you see multiple triggering words or any other tricking situations that needs revisiting, but do not abuse this function.
