

You were previously solving a coding problems. Here is the problem that you were solving:

```
{problem_dict[query['problem_id']]['description']}
```

And here are all your past attempts, as well how your code fared on the unit tests for the problem:

```
{query['reflection_buffer']}
```

Think carefully about where you went wrong in your latest solution, first outputting why you think you went wrong. Then, given your insights, try to fix the solution, outputting a block of correct python3 code to be executed and evaluated again. Make sure to wrap your code in '``python' and '``' Markdown delimiters.
