

mymath.py > calculate_average

```
1 def calculate_average(numbers):  
2     """  
3     Calculate and return the  
4     average of a list of numbers.  
5     """  
6     total = sum(numbers)  
7     count = len(numbers)  
    return total/count
```

 You could optimize your code by not using the two temporary variables and directly returning the result of the function.
