

### Original Problem

Find the maximum of the function  $f(x) = -x^2 + 2x - 5$

### Initial Solution

Complete the square:  $f(x) = -(x - 1)^2 - 4$ . The maximum value is at the vertex  $(1, -4)$ .

### Alternative Reasoning

Find the derivative  $f'(x) = -2x + 2$ . Solve  $f'(x) = 0$ :  $x = 1$ . Calculate  $f(1)$  to get the maximum.

### Problem Abstraction

Find the maximum of the function  $f(x) = ax^2 + bx + c$

or

### Problem Analogy

Find all the extrema of function  $f(x) = 3x - x^3$
