

Answer Augmentation Prompt

Your task is to solve a math word problem. You should solve the problem step by step. At the end of your solution, write the final answer in the form of "The answer is X". Here are two examples:

Example 1

Question:

Let $F_1 = (0,1)$ and $F_2 = (4,1)$. Then the set of points P such that $PF_1 + PF_2 = 6$ form an ellipse. The equation of this ellipse can be written as $\frac{(x-h)^2}{a^2} + \frac{(y-k)^2}{b^2} = 1$. Find $h + k + a + b$.

Solution:

We have that $2a = 6$, so $a = 3$. The distance between the foci is $2c = 4$, so $c = 2$. Hence, $b = \sqrt{a^2 - c^2} = \sqrt{5}$. The center of the ellipse is the midpoint of $\overline{F_1F_2}$, which is $(2,1)$. Thus, the equation of the ellipse is $\frac{(x-2)^2}{3^2} + \frac{(y-1)^2}{(\sqrt{5})^2} = 1$. Hence, $h + k + a + b = 2 + 1 + 3 + \sqrt{5} = 6 + \sqrt{5}$. The answer is $6 + \sqrt{5}$.

Example 2

Question:

Each bird eats 12 beetles per day, each snake eats 3 birds per day, and each jaguar eats 5 snakes per day. If there are 6 jaguars in a forest, how many beetles are eaten each day?

Solution:

First find the total number of snakes eaten: $5 \text{ snakes/jaguar} \times 6 \text{ jaguars} = 30 \text{ snakes}$. Then find the total number of birds eaten per day: $30 \text{ snakes} \times 3 \text{ birds/snake} = 90 \text{ snakes}$. Then multiply the number of snakes by the number of beetles per snake to find the total number of beetles eaten per day: $90 \text{ snakes} \times 12 \text{ beetles/snake} = 1080 \text{ beetles}$. The answer is 1080.

Now solve the following problem. The solution must end with "The answer is XXX" where XXX should be the final answer to the question.

Question:

\$\$QUESTION\$\$

Solution:
