

## Question

## Answer

## Reflection

### Original Problem

Find the maximum of  
 $f(x) = -x^2 + 2x - 5$

### Initial Solution

Complete the square:  
 $f(x) = -(x - 1)^2 - 4$ .  
The maximum is at the  
vertex  $(1, -4)$

### Alternative Reasoning

Find the derivative  
 $f'(x) = -2x + 2$ .  
Solve  $f'(x) = 0$ :  $f(1)$   
is the maximum.

### Follow-up: Abstraction

Find the maximum of  $f(x) = ax^2 + bx + c$

or

### Follow-up: Analogy

Find all extrema of  $f(x) = 3x - x^3$
