

## Step 1: Image Pre-selection

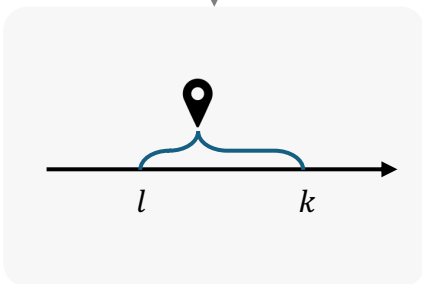

Recollect images  
from existing  
datasets

Get predictions  
from CLIP

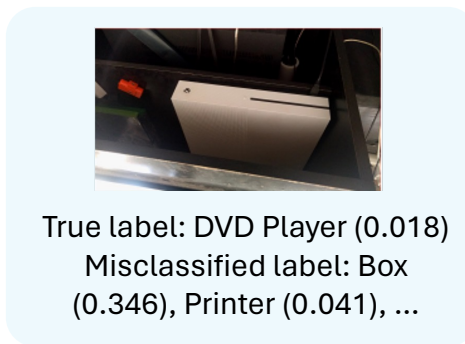

Sort the logit  
vector, find true  
class prediction  
not in top  $k$  but in  
top  $l$ .

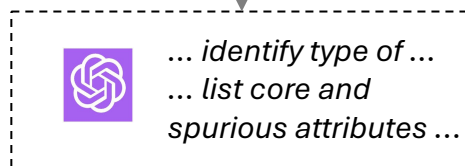

## Step 2: Type Identification / Concept Extraction

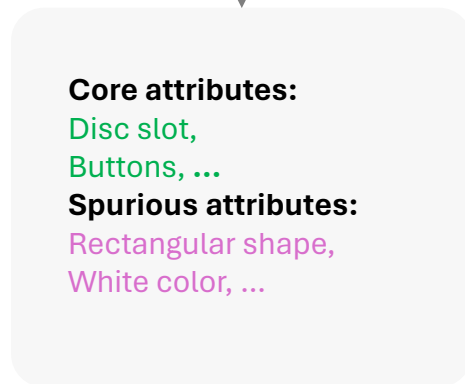

Extract true label  
and misclassified  
labels

Provide GPT-4 the  
types and  
extracted labels

List out  
core/spurious  
attributes

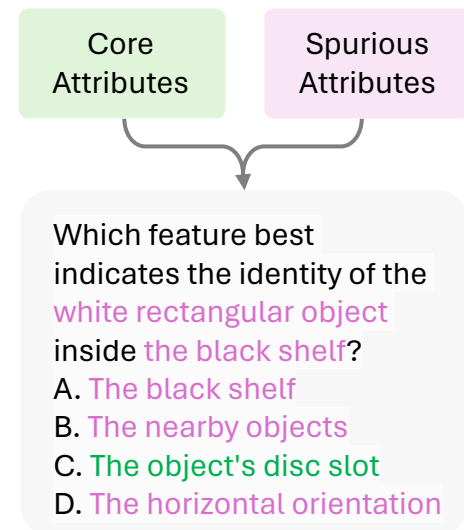

## Step 3: VQA Generation

Generate a multiple choice question based  
on ... if models associate the spurious  
attributes with the true object ...

Prompt to add the  
spurious attributes  
and core attributes  
for VQA generation

Filter out VQAs  
not aligning with  
human knowledge

Are the VQA pairs  
understandable  
and correct?

Keep / Discard
