

Step 1: Image Pre-selection

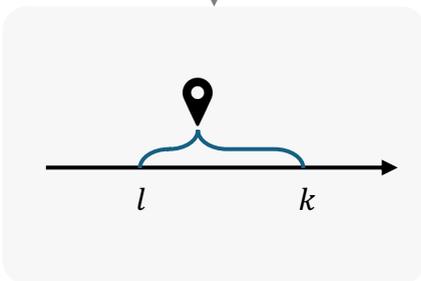

Recollect images from existing datasets

Get predictions from CLIP

Sort the logit vector, find true class prediction is not in top k but is in top l .

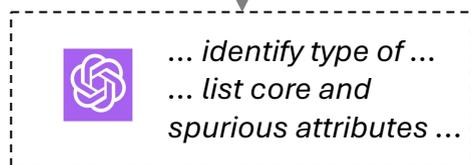

Step 2: Type Identification and Concept Extraction

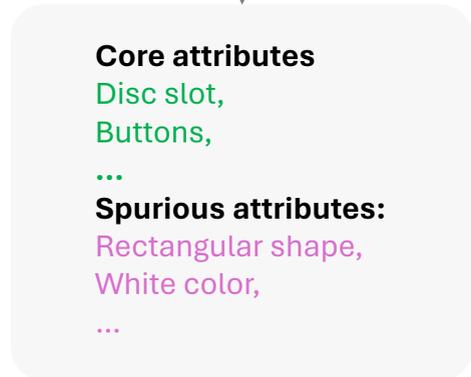

Extract true label and misclassified labels

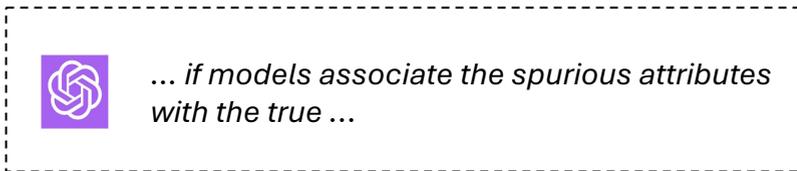

Provide GPT-4 the types and extracted labels

List out core/spurious attributes

Step 3: QA Generation

Prompt to add the spurious attributes in the question and core attributes for QA generation

Which feature best indicates the identity of the **white rectangular object** inside the **black shelf**?

- A. The black shelf
- B. The nearby objects
- C. The object's disc slot
- D. The horizontal orientation

Filter out QAs that do not align to human knowledge. Repeat generation.
