

Code Implementation for the Species Identification Interface

```
1 import tensorflow as tf
2 import tensorflow_hub as hub
3 import numpy as np
4 from PIL import Image
5
6 class SpeciesIdentificationInterface:
7     def __init__(self):
8         self.model = hub.load("https://tfhub.dev/google/imagenet/mobilenet_v2_100_224/classification/5")
9         self.labels = self.load_labels()
10
11     def load_labels(self):
12         labels_path = tf.keras.utils.get_file(
13             'ImageNetLabels.txt',
14             'https://storage.googleapis.com/download.tensorflow.org/data/ImageNetLabels.txt'
15         )
16         with open(labels_path, 'r') as f:
17             labels = f.read().splitlines()
18         return labels
19
20     def preprocess_image(self, path_to_img):
21         img = Image.open(path_to_img).resize((224, 224))
22         img = np.array(img) / 255.0
23         img = np.expand_dims(img, axis=0)
24         return img
25
26     def identify_species(self, path_to_img):
27         img = self.preprocess_image(path_to_img)
28         predictions = self.model(img)
29         predicted_class = np.argmax(predictions, axis=-1)[0]
30         return predicted_class
31
32 # Example usage:
33 if __name__ == "__main__":
34     interface = SpeciesIdentificationInterface()
35     path_to_img = "path/to/your/image.jpg" # Replace with your image path
36     predicted_class_index = interface.identify_species(path_to_img)
37     print(f"Predicted class index: {predicted_class_index}")
38     print(f"Predicted species: {interface.labels[predicted_class_index]}")
39
```
